Estimating construction materials starts with a basic count of the framing lumber, often called a framing takeoff. A takeoff for a wall frame includes counting the studs (typically 2x4 or 2x6), the headers for door and window openings (using 2x12s is simplest), and horizontal plates for the top and bottom of the wall (plates use the same lumber as the studs).

The study aim was to compare different predictive models in one repetition maximum (1RM) estimation from load-velocity profile (LVP) data. Fourteen strength-trained men underwent initial 1RMs in the free-weight back squat, followed by two LVPs, over three sessions. Profiles were constructed via a combined method (jump squat (0 load, 30-60% 1RM) + back squat (70-100% 1RM)) or back squat ...
