Two different freezing methods are used for pharmaceutical products: freezing by contact with cooled surface; or rotation/dynamic freezing in a coolant bath. The first method is a static freezing technique in which a versatile freeze dryer must be capable of adjusting the freezing rate to the specific product and control the freezing speed.

Design of freeze-drying processes is often approached with a “trial and error” experimental plan or, worse yet, the protocol used in the first laboratory run is adopted without further attempts at optimization. Consequently, commercial freeze-drying processes are often neither robust nor efficient. It is our thesis that design of an “optimized” freeze-drying process is not particularly ...

Freeze drying, also known as lyophilisation or cryodesiccation, is a low temperature dehydration process that involves freezing the product, lowering pressure, then removing the ice by sublimation. This is in contrast to dehydration by most conventional methods that evaporate water using heat. Because of the low temperature used in processing, the quality of the rehydrated product is excellent ...
